

Feedback from Evaluation on Non-Passing Aspects

These are the steps the evaluator took when running your submission. The screenshots show the results they saw. It is important to remember that evaluation is not allowed to instruct. We are only allowed to note what is working and what is not working. If you need additional instructional support, please reach out to a course instructor.

Aspect # I from 011294017

Steps Taken

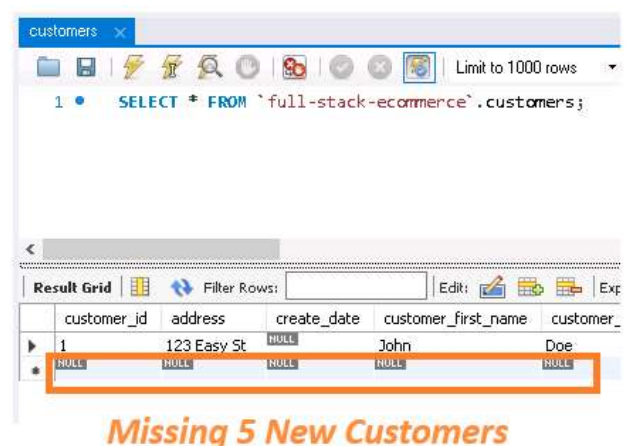

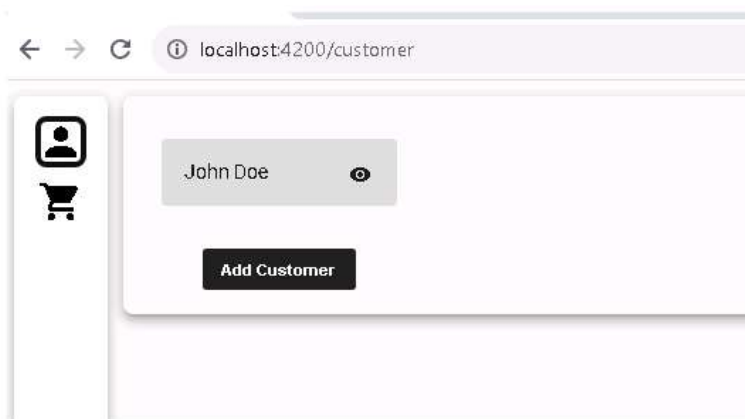

Of the two branches, the master branch was used for the App since it has the most recent date stamps.

1. Compile the launch the back-end. 2. Load the front-end. 3. From the front-end in the browser, click the left customer icon where only default customer is visible. 4. Run the App, add selections to cart, and complete checkout for an order. 5. Again, click the left customer icon where only default customer is visible.

Results:

The App doesn't yield the required five new customers. While the SampleDataInitializer class is coded for new customers, the database remains with only the default customer in the table after the execution of the App.

Screenshots:

Please see next page.

Aspect # J

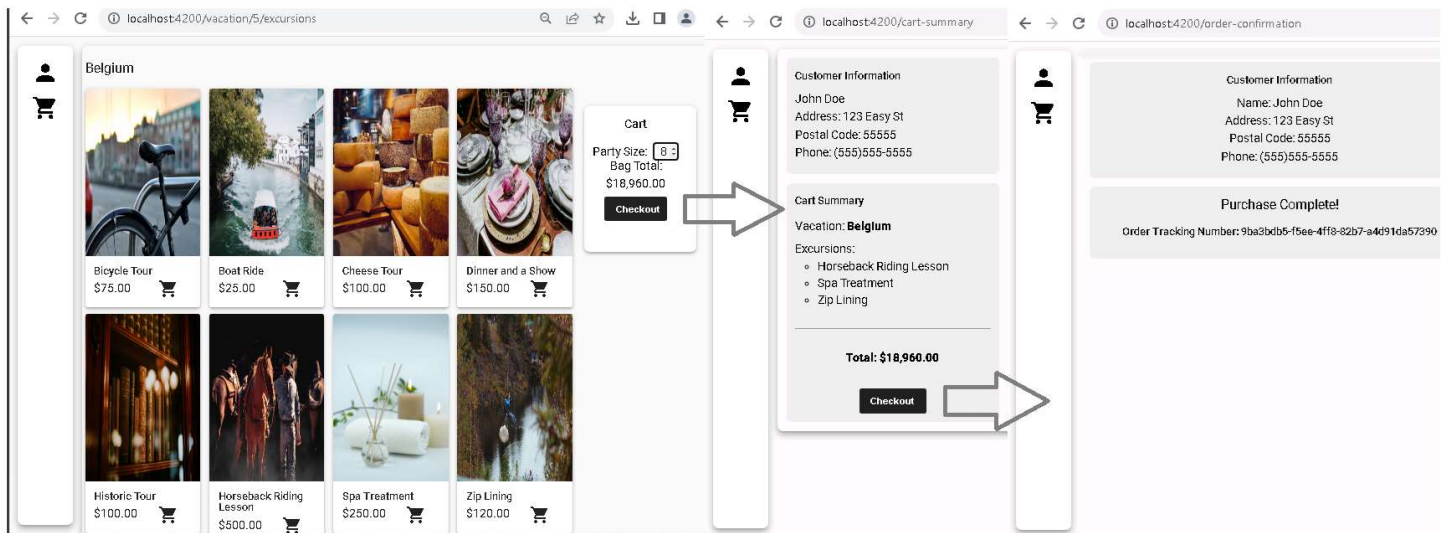

Steps Taken

1. Start the back-end. 2. Run the App in a browser from localhost:4200. 3. Add selections to cart, and complete checkout for an order.

Results:

While the App writes the some order data to the carts table, a value of "pending" is written in the Status column where a value of "ordered" should be. Some fields in the carts table, such as create_date and last_update do not receive their values and remain as nulls. The Cart_Items table and Excursion_Cartitem table do not contain a record from the purchase. (Please see attached document with screenshots.) Please ensure that orders are fully written to the database following the checkout.
